

PatientTrak.net's on-demand pricing structure allows healthcare organizations the ability to achieve virtually instant return-on-investment (ROI). Within days of first use, your organization will be performing on-line analysis of patient activity, from peak times and top performer reports, to resource utilization analyses. The value of the information gathered via PatientTrak.net's on-line tracking system exceeds PatientTrak.net's per-computer investment.

PatientTrak.net hosts its service in a secure and stable environment, allowing your organization to focus on patient healthcare activities, instead of computer hardware and software maintenance and licensing. In addition, due to the simplicity in the services design, consulting and training time are minimized with PatientTrak.net. In fact, in a typical PatientTrak.net deployment, the only investment required by a healthcare organization is the per-computer monthly fee charged for the usage of the on-line service, virtually eliminating all of the costs typically associated with the implementation of a computerized patient-tracking system.

The charts below compare the investment required to implement a typical computerized patient-tracking system with the investment required to implement the PatientTrak.net hosted service. Note: This chart assumes an organization that is tracking 100,000 patients annually.

This chart displays the year-one costs associated with implementing a typical computerized patient-tracking system:

This chart displays the year-one investment required to implement PatientTrak.net's hosted solution:
